

Git Hands-on - Exercise 2 (.gitignore)

Exercise: Implement .gitignore

Aim

To implement the .gitignore file to ignore unwanted files and folders from being tracked by Git.

Procedure

1. Navigate to project folder
`cd /e/DEEPSKILLING/"MODULE 11 GIT"/GitIgnoreDemo`
2. Initialize the repository
`git init`
3. Create a log file
`touch error.log`
4. Create a log directory
`mkdir log`
5. Create a sample file inside log
`touch log/sample.txt`
6. Create the .gitignore file
`touch .gitignore`
7. Open the file
`notepad .gitignore`
8. Add the following lines
`*.log`
`log/`
9. Check repository status
`git status`
10. Stage the .gitignore file
`git add .gitignore`
11. Commit changes
`git commit -m "Added .gitignore file"`
12. Push to GitHub
`git push -u origin main`

Expected Result

The .gitignore file ignores all .log files and the log folder. Only the required project files are committed and pushed to GitHub.

- GitHub repository after successful push

Conclusion

The .gitignore file was successfully implemented to ignore unwanted files and folders. The repository was committed and pushed to GitHub successfully.
